RAIFFEISEN BANK ROMANIA · AI FOR OPERATIONAL EFFICIENCY

TRACE

Tax Residency and Anomaly Correlation Engine

When a customer's data changes, the bank must find out again where they pay tax.

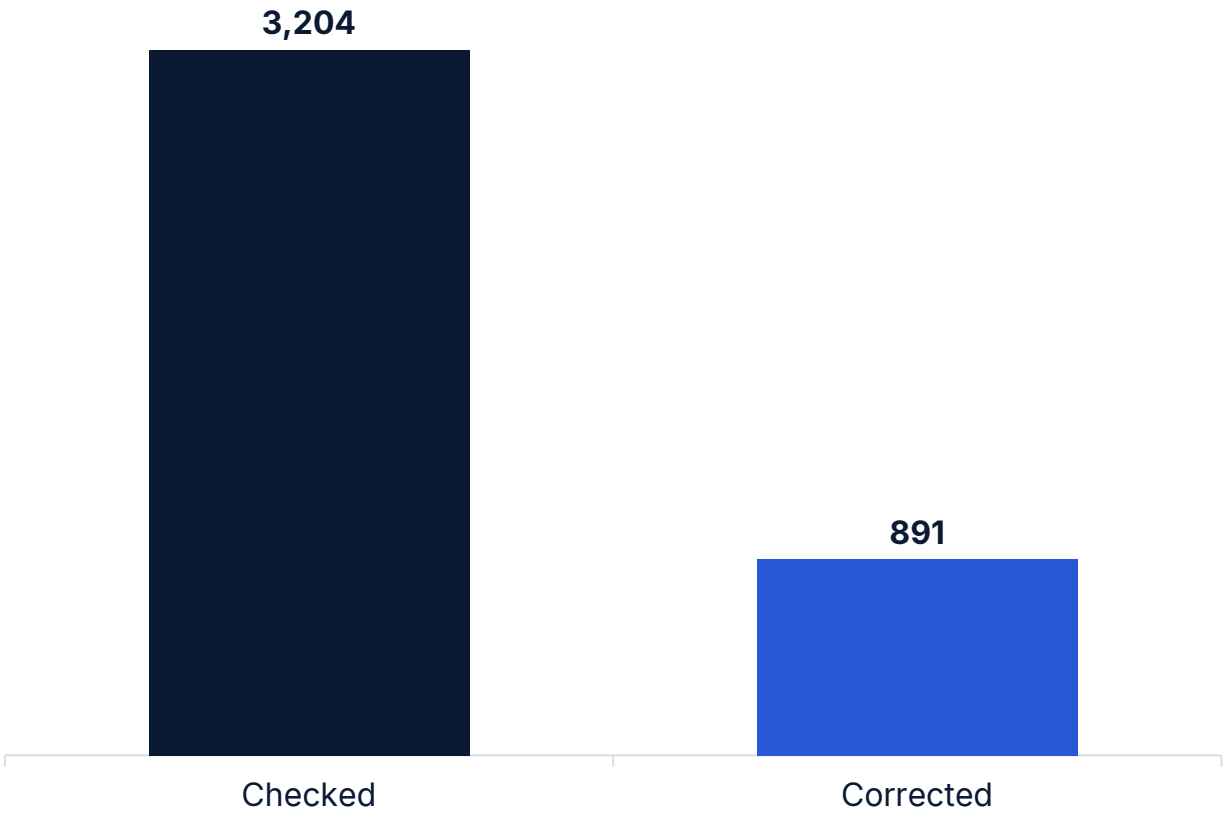

For a new account it has 90 days. **Today, it is done by hand.**

NEXXT AI Hackathon · 29 October 2026

THE PRESSURE

The regulator is already checking the data.

Records reported by financial institutions, checked by ANAF in H1 2025

28%

of checked records needed a correction, sector-wide

2,000-10,000 lei

fine for each account reported wrongly

2.4 million

Raiffeisen customers whose tax residency must stay current

Sources: ANAF activity report H1 2025, p. 36-37 (sector-wide) · Fiscal Procedure Code, art. 336(2)(k^1), (k^2) · Raiffeisen Bank Romania press release, 28.10.2026

THE EXPOSURE

The fine is per account, so the risk grows with volume.

Fine range set by law, by number of accounts reported wrongly (thousand lei)

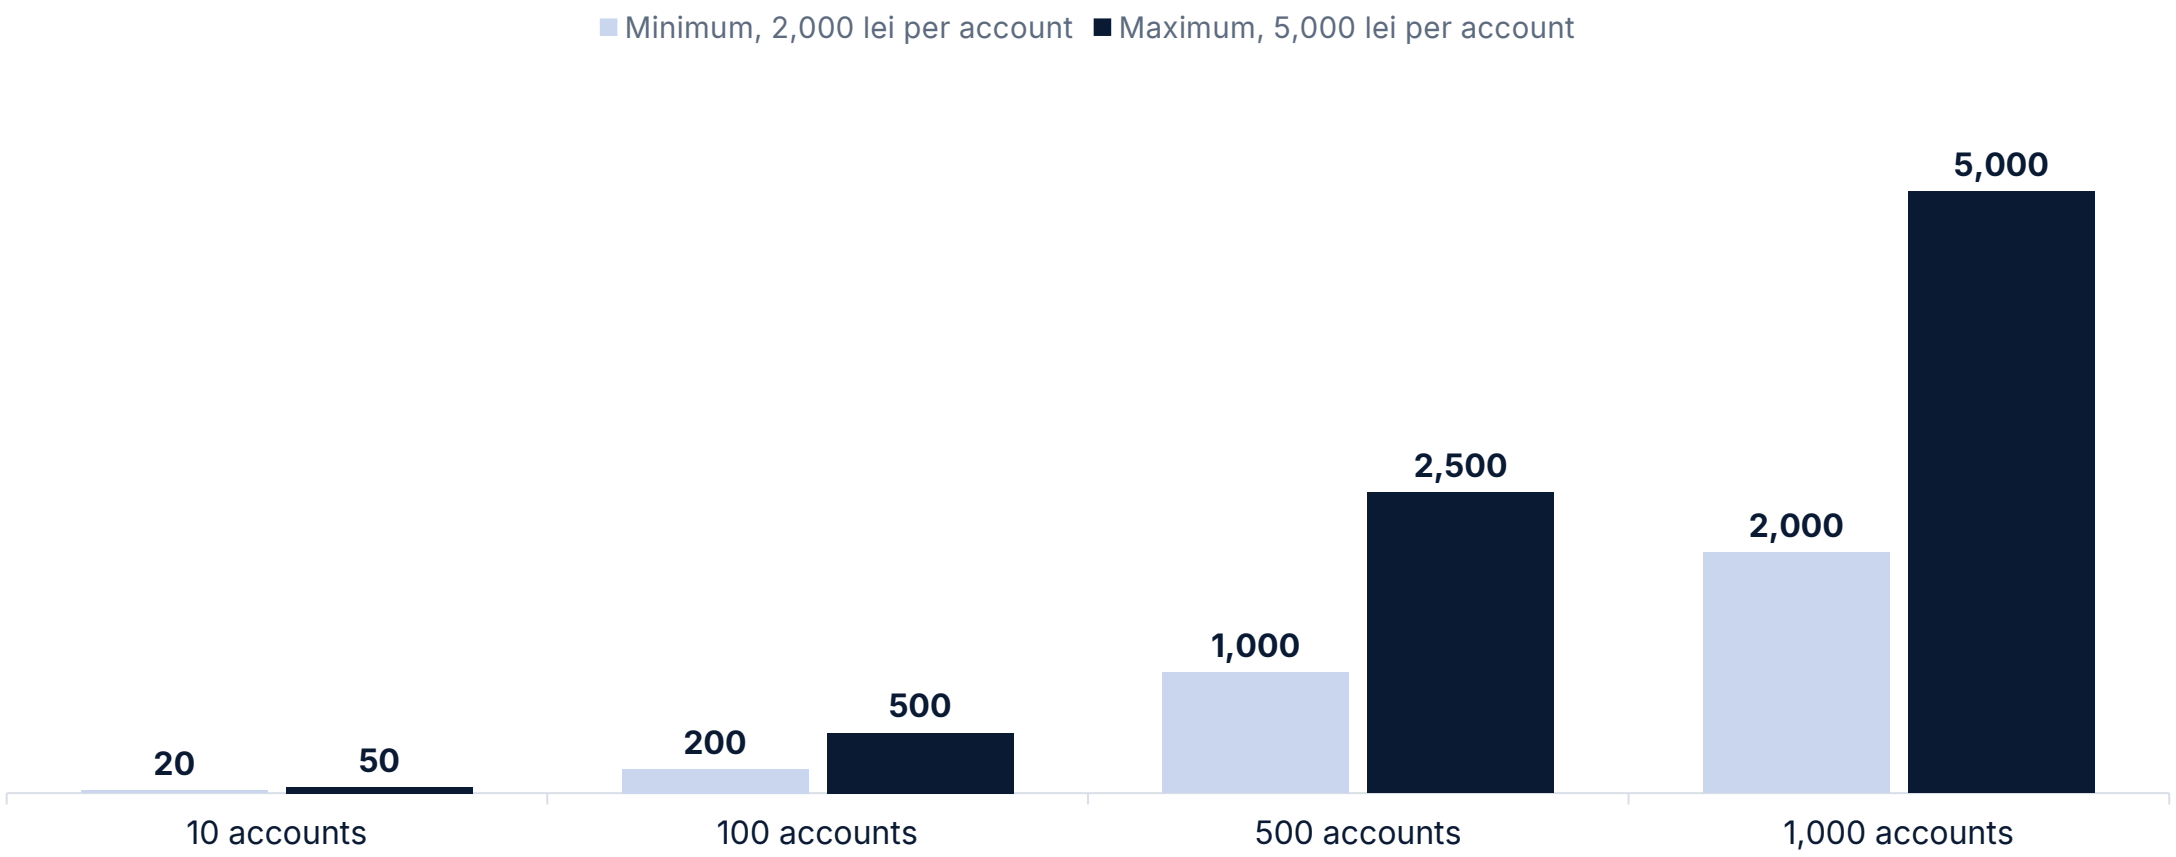

Illustration: fine per account (Fiscal Procedure Code, art. 336(2)(k^1)) multiplied by the number of accounts. Without due diligence procedures: 5,000-10,000 lei per account.

THE PROBLEM, IN ONE CUSTOMER

One move. Two indicia. Ninety days.

Maria Popescu moves to Munich and switches to a German phone.

Address in Germany
CRS-IND-ADDR · guide p. 29 b

German phone, no Romanian phone
CRS-IND-PHONE · guide p. 29 c

Day 85
Reminder and escalation

Day 0
Change received, case opened

Day 90
Legal deadline

No valid answer by day 90: she is treated as tax resident in Romania and in Germany.

WHY IT IS HARD

Similar changes. Opposite answers.

A German phone, next to a Romanian one	**No case**	guide p. 29 c
A standing order to Germany, from a current account	**No case**	guide p. 29 d
The same order, to the United States	**FATCA alert**	guide p. 31
A move from Cluj to Iasi	**No case**	domestic

Miss one: a fine per account. Flag one wrongly: wasted work and a confused customer.

THE PRINCIPLE

Code decides. AI explains. A person approves.

CODE — Applies the rules, cites the page and starts the deadline.

AI — Reads the documents, quotes the evidence, drafts the letter.

PERSON — Approves every letter and every closing.

THE AGENT

One agent. Two human checkpoints.

WHEN A CASE OPENS

- Reads the documents
- Quotes the evidence
- Drafts the letter
- **Person approves the letter**

WHEN THE CUSTOMER ANSWERS

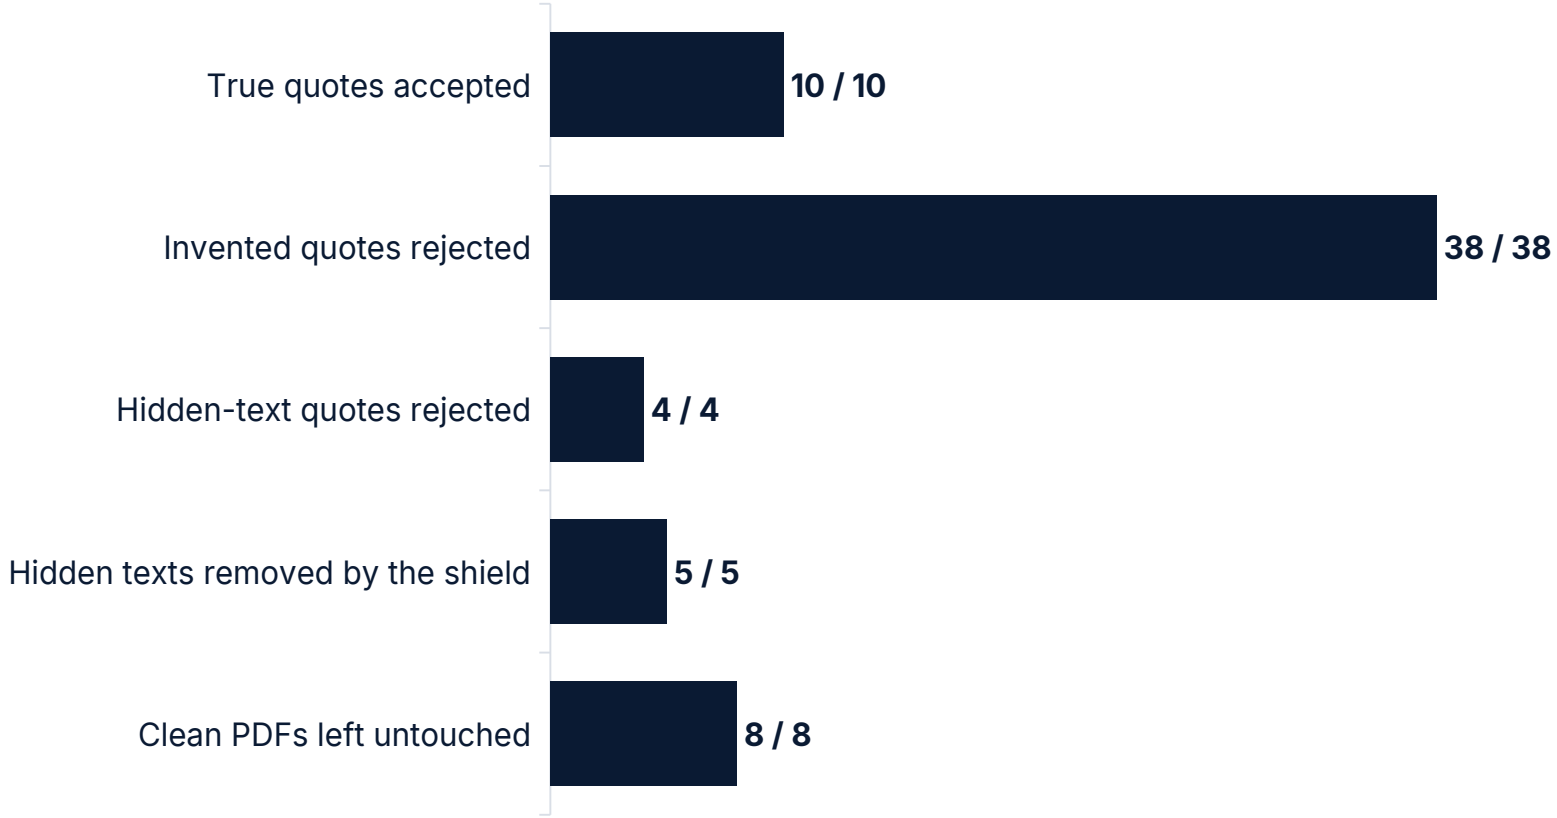

- Reads the new declaration
- Checks the TIN format
- Code re-runs the rules
- **Person approves the closing**

14 tools · Claude on Amazon Bedrock · The model never decides an indicium, a deadline or an alert.

TRUST

AI output counts only after code checks it.

Test bench: checks passed, out of cases tested

65 / 65

checks passed on the test bench

5

kinds of personal data masked before the model

SHA-256

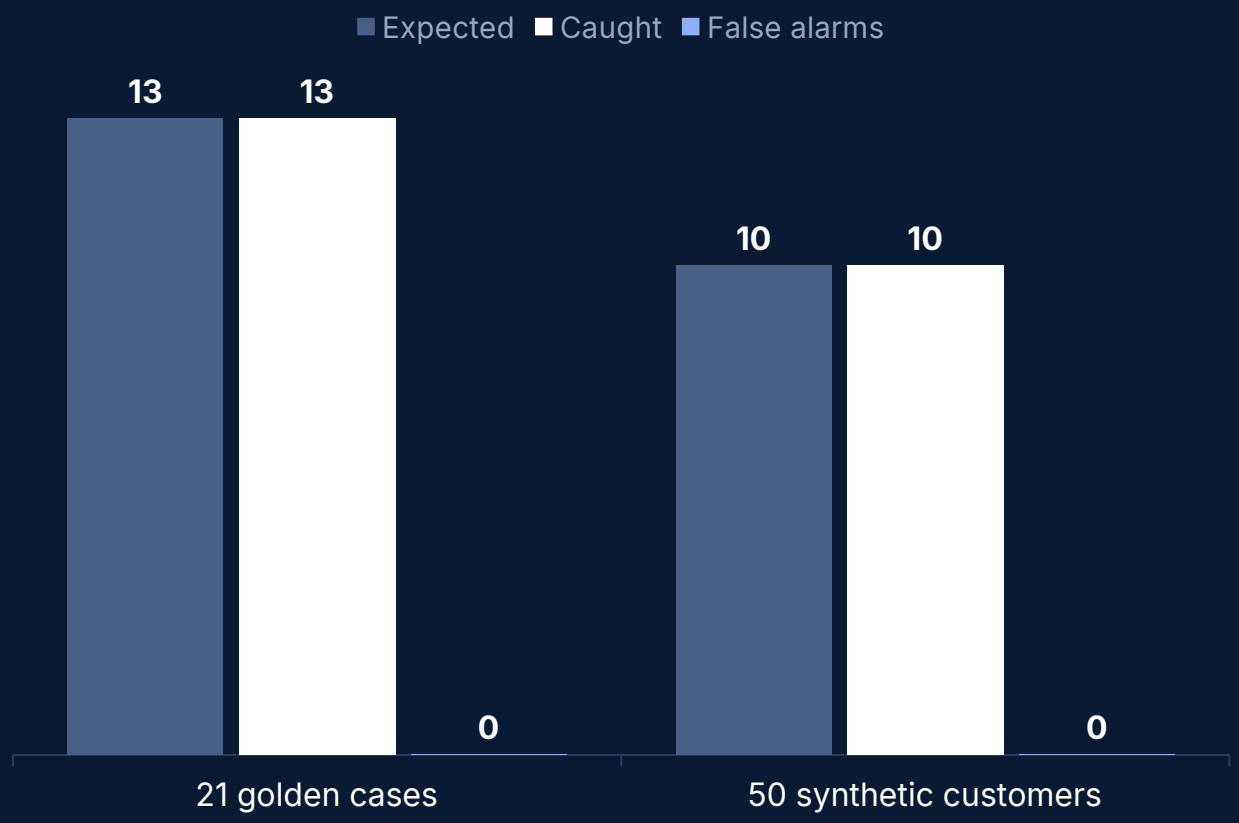

chain over every step of every case

Test bench in the repository (EvidenceVerifier and HiddenTextShield tests), 12 generated PDFs, synthetic data.

RESULTS

23 caught. 0 missed. 0 false alarms.

Expected actions vs. caught, last evaluation run

0

missed indicia, on both sets

0.03 ms

per rule evaluation, the code only

1,600+

automated tests passing on every build

Correct answers written before the code. We do not claim 100% accuracy; time saved per case is not measured yet.

THE ASK

A shadow pilot, then a decision.

1 Connect

A read-only copy of the data-change feed. Nothing changes in production.

2 Shadow

TRACE decides next to the operators on real changes. We compare decisions and time per case.

3 Decide

Go or no-go with the tax department, on measured results.

WHAT WE NEED FROM THE BANK

A sample of real data changes

A review of our documented interpretations by the tax department

A model endpoint in an EU region or inside the bank

TRACE Code decides. AI explains. A person approves.
